

Consumer Debt Stress Index Report: October 2009

Stress on Consumers from Debt Continues to Fall as Economy Shows Signs of Recovery

Lucia F. Dunn & Ida Mirzaie*

The Consumer Debt Stress Index (DSI), which measures psychological stress on consumers from all sources of debt, fell again in October 2009, reaching a value of 130.1 compared to its September level of 132.8. The Index spiked at a record 155.3 last July, which meant that consumers last summer were experiencing stress levels from the debt that were more than 50 percent higher than they had been in the January 2006 base period, when the index had a value of 100. The continuing flow of more favorable economic news, including the substantial 3.5 percent annual growth in Gross Domestic Product for the third quarter, has undoubtedly relieved consumers' concerns about their ability to manage their debts to some extent. Nevertheless, a value of 130 is still high for the DSI by historic standards, and such high levels of debt stress could cause consumers to tighten their purse strings in coming months. Thus the index will be monitored closely as we move into the critical end-of-year holiday shopping season.

The path of the index since its inception is plotted in Figure 1 below. Looking at the history of the index, it remained in the range of the 90s throughout most of 2006 and the first half of 2007. The index reached its historic low point of 90.3 in May 2007, just before the collapse of the subprime mortgage market. The subprime collapse brought a sharp turnaround in the index; and by October of 2007, the index had jumped over the 100 mark. It continued its upward trajectory -- as shown in the diagram in Figure 1 below -- as the economy slide into recession at the end of 2007 and consumers struggled to manage their debts in the midst of the worse economic downturn since the Great Depression. Another up-tick in debt stress for U.S. households was recorded in the early fall of 2008 amid the turmoil in financial markets brought about by the bankruptcy of Lehman Brothers and a general tightening of credit conditions. The index continued its upward trend through July as debt-burdened consumers fought to stabilize their finances in the midst of a high-unemployment economy

Later in the summer, as reports on the economy became more encouraging, the more favorable news clearly brought some psychological relief to consumers. August saw the first signs that debt stress was moderating. The downward trend in stress continued in September with a strong 10 percent drop in the DSI. Another more modest drop occurred in October, leaving the index at its current value of 130.1.

* Dr. Dunn and Dr. Mirzaie are Professor and Senior Lecturer respectively in the Department of Economics, Ohio State University, Columbus, Ohio.

Table 1: OVERALL CONSUMER DEBT STRESS INDEX

Gender Differences: *Women More Stressed by Debt*

Stark differences are apparent between the genders in the survey, with women in the sample in general showing a greater degree of debt stress than males. Our previous examinations have shown that there are two factors contributing to this gender difference. The first is the fact that the ratio of debt to income is higher for women. Secondly, even *for the same level of debt-to-income*, the amount of debt stress that a woman experiences is approximately a third higher than the debt stress that a man experiences.

However, our most recent survey results show that debt stress is abating faster for women than for men. In October, the index for women showed a substantial decline to a value of 136.0 from 143.6 the previous month. Debt stress levels for men, on the other hand, were roughly the same in both months: 122.9 in October compared to 120.7 in September.

Effects on Family Life, Job Performance, and Health

Further insight into the impact that debt is having on American households can be gleaned from additional questions asked in the survey. These questions probe the degree to which debt has affected the respondent’s (a) family life, (b) job performance, and (c) health. Results from these questions are reported on a monthly basis along with the Debt Stress Index so that changes in these critical life aspects for the U.S. population can be tracked over time. The numbers in the tables presented below represent averages for the three-month period ending in the month indicated in the column heading.

These additional questions show that the problems created by debt for respondents’ family life and job performance have also been increasing over the past few years since the base period of January 2006. However, in October there was also a lessening of the stress reported in these categories. Whereas 30.3 percent of the sample fell in the top three problem categories for the impact on debt on family life in September 2009, in October that number had fallen to 24.3 percent. Likewise, in September 16.2 percent of the sample fell in the top three problem categories for the impact of debt on job performance; but by October, that number had fallen to 12.2 percent of the sample.

The negative impact of debt on health also lessened last month. In September 2009, 25.7 percent of respondents in the sample reported a noticeable impact of debt on their health (i.e., in the top three problem categories). In October, that percentage was down to 21.9 percent of the sample. Although this improvement is welcome news, the numbers are still troubling. The health issues arising from debt stress have been explored in detail by Lavrakas and Tompson in the 2008 annual Associated Press poll, which showed that debt stress is positively associated with migraines, back problems, ulcers, heart problems, and other debilitating conditions.

Problem of Debt for Family Life*

<i>Response Category</i>	<i>Percentage Response</i>	<i>Percentage Response</i>	<i>Percentage Response</i>	<i>Percentage Response</i>
	October 2009	September 2009	October 2008	January 2006
Extreme Problem	5.9%	10.3%	2.8%	3.4%
Large Problem	6.3	6.1	7.7	2.7
Medium Problem	12.1	13.9	16.7	11.4
Small Problem	18.2	16.5	18.6	19.5
No Problem At All	57.5	53.2	54.3	63.0

* 3-month period sample sizes are: 413 for January 2006; 636 for October 2008; 404 for September 2009; 412 for October 2009.

Problem of Debt for Job Performance

July 2008	116.9
August 2008	117.3
September 2008	125.0
October 2008	129.0
November 2008	129.0
December 2008	130.6
January 2009	123.3
February 2009	127.9
March 2009	128.6
April 2009	139.9
May 2009	147.2
June 2009	148.7
July 2009	155.3
August 2009	147.6
September 2009	132.8
October 2009	130.1

¹ The months of March and April of 2006 and June through September of 2007 are not represented due to a pause in the debt stress survey questions.

Appendix B: Background to the Index

The Consumer Debt Stress Index (DSI) was developed by researchers at the Ohio State University. It is derived from data taken in a nationwide household survey and is released on a monthly basis to systematically track the psychological stress that consumer debt is causing in the U.S. population.

The(DSI) is based on questions which probe stress from all consumer debt sources including mortgages, credit cards, home equity loans, car loans, student loans, etc. Using a five-point scale, the survey questions elicit the following: (a) frequency of worry over debt; (b) amount of stress from debt; (c) extent of expected problems from debt over the next five years; and (d) concern about the inability to ever pay off debt. The questions were developed at the Ohio State University under the leadership of Dr. Paul J. Lavrakas, as reported in the *American Statistical Association Proceedings, 2000*.² They have been implemented in a monthly survey of a national random sample of US households by the Center for Human Resource Research at the Ohio State University since 2005.³ The index is designed so that it has a value of 100 in an initial month, or base period, which is January 2006. Its values in subsequent months show how the level of stress over debt has been changing over time for households.

This index is a compliment to debt stress measures arising from the annual Associated Press poll as reported by Lavrakas and Tompson⁴ using the same survey questions. The monthly DSI reported here will allow for a more frequent reading of the stress situation. It is also computed in a different way so as to show the percentage change in stress among the U.S. population from the original base period.

² The wording of the questions used in the index appears in Appendix C.

³ The data are drawn from a nationwide random digit dialing telephone survey conducted by the Center for Human Resource Research at Ohio State University. The reported figure represents a three-month moving average of the index values, with the average sample size being 658. The sample size for the October 2009 index is 395. The months of March and April of 2006 and June through September of 2007 are not represented due to a pause in the survey questions.

Appendix C: Construction of Debt Stress Index and Survey Questions

The Debt Stress Index is based upon four survey questions which are presented below. The five possible response categories are coded from zero to four with zero being the lowest stress category, as well as the category that contains respondents with no debt. Each month the four response numbers $X_{i,j}$ for each individual respondent are averaged.⁵ To obtain the “raw score” for the index from the individual scores, we next average across the n individuals in the sample for that month. Finally, we incorporate a base period.

Incorporating a base period into the construction of an index is critical for allowing a given period’s index value to be compared to the value of the index from another period of interest. For example, the Index of Consumer Sentiment computed by the Survey Research Center at the University of Michigan chooses 1966 as its base year and constructs its index to have a value of 100 in that year. For the Debt Stress Index presented here, the initial period of available data, January 2006, was chosen as the base period, and the raw score value of the index in that period is 0.9460. Dividing each period’s raw score by this base period (and multiplying by 100), the base period is thus defined to have the value of 100 and subsequent monthly periods are defined relative to that initial period.

The computation of the index, referred to as the DSI, can thus be represented as follows:

$$DS_i = \frac{1}{4}(X_{i,1} + X_{i,2} + X_{i,3} + X_{i,4})$$
$$DSI = \frac{100}{0.946} \times \frac{1}{n} \sum_{i=1}^n DS_i$$

To enhance the statistical reliability of the index, we have used a rolling three-month technique whereby the index is based on three months of data, with data from the most recent month added and data from the oldest month dropped in a rolling fashion. Thus, for example, the September index is based on data from July, August, and September.

Index Questions

The wording of the survey questions is presented below.

1. Overall, how often do you worry about the total amount you (and your spouse/partner) owe in overall debt? Would you say you worry (a) all of the time; (b) most of the time; (c) some of the time; (d) hardly ever; or (e) not at all?

⁵ The responses of the sample are weighted using U.S. Census data to more accurately reflect the socioeconomic make-up of the general population.

2. How much stress does the total debt you (and your spouse/partner) are carrying cause to you? It is (a) a great deal of stress; (b) quite a bit; (c) some stress; (d) not very much; or (e) no stress at all?

3. Now, thinking ahead over the next five years, how much of a problem, if any, will the total debt you (and your spouse/partner) have taken on be for you? Will it be (a) an extreme problem; (b) a large problem; (c) medium problem; (d) small problem; or (e) no problem at all?

4. How concerned are you that you (and your spouse/partner) will *never* be able to pay off these debts? Are you (a) very much concerned; (b) quite concerned; (c) somewhat concerned; (d) not very concerned; or (e) not at all concerned?

Questions for Additional Areas of Impact for Debt Stress – Not Part of DSI

1. How much of a problem, if any, has your debt caused for your family life? Is it an extreme problem, a large problem, a medium problem, a small problem, or no problem at all?

2. How much of a problem, if any, has your debt caused for your job performance? Is it an extreme problem, a large problem, a medium problem, a small problem, or no problem at all?

3. To what extent has your debt affected your health. Very much affected, quite affected, somewhat affected, not much affected, or not at all affected?
